

## Exercise #17

We have given,  
 $min\_sup = 3$

Each item can be represented by an integer (i.e. 4 bytes)

Each lock can be represented by an integer (i.e. 4 bytes)

For the Fixed Locking approach, the number of locks used is 8.

The size of a cache block is 64 bytes.

We have given below transactions,

T1: {P1, P2, P3, P5, P7}

T2: {P1, P4, P5, P6, P7}

T3: {P1, P4, P6}

T4: {P1, P4, P5, P6, P7}

T5: {P3, P5}

T6: {P1, P2, P3, P7}

T7: {P2, P7}

T8: {P1, P2, P3, P4, P6, P7}

Below table shows discovery of frequent item sets.

Ck - Size 1 (7)	Ck - Size 2 (21)	Ck - Size 3 (9)	Ck - Size 4 (2)
P1 = 6	P1, P2 = 3	P1, P2, P3 = 3	P1, P2, P3, P7 = 3
P2 = 4	P1, P3 = 3	P1, P2, P7 = 3	P1, P4, P6, P7 = 3
P3 = 4	P1, P4 = 4	P1, P3, P7 = 3	
P4 = 4	P1, P5 = 3	P1, P4, P6 = 4	
P5 = 4	P1, P6 = 4	P1, P4, P7 = 3	
P6 = 4	P1, P7 = 5	P1, P5, P7 = 3	
P7 = 6	P2, P3 = 3	P1, P6, P7 = 3	
	P2, P4 = 1	P2, P3, P7 = 3	
	P2, P5 = 1	P4, P6, P7 = 3	
	P2, P6 = 1		
	P2, P7 = 4		
	P3, P4 = 1		
	P3, P5 = 1		
	P3, P6 = 1		
	P3, P7 = 3		
	P4, P5 = 2		
	P4, P6 = 4		
	P4, P7 = 3		
	P5, P6 = 2		
	P5, P7 = 3		
	P6, P7 = 3		

$S = \text{Size of Reduction object} = 4 * \# \text{ of Reduction Elements}$

$T = \# \text{ of Threads (Processors)}$ .

Number of threads are not given so, I have assuming  $T = 4$ ,

$r = \# \text{ of Elements}$

1. In Ck with Size 1, we have 7 Reduction Element in one Reduction Object;
  - Full Replication =  $S * T$   
Where  $S = 7*4 = 28$  and  $T = 4$   
 $S*T = 28*4 = 112$  Bytes
  - Full Locking and Optimized Full Locking =  $2 * S$   
Where  $S = 7*4 = 28$   
 $2*S = 2*28 = 56$  Bytes
  - Fixed Locking and Cache-Sensitive Locking =  $(1 + 1/r) * S$   
Where  $S = 7*4 = 28$  and  $r = 7$   
 $(1 + 1/r) * S = (1+1/7)*28 = 32$  Bytes
2. In Ck with Size 2, we have **21** Reduction Element in one Reduction Object: (Bold figures are correction from my previous submission)
  - Full Replication =  $S * T$   
Where  $S = \mathbf{21*4 = 84}$  and  $T = 4$   
 $S*T = \mathbf{84*4 = 336}$  Bytes
  - Full Locking and Optimized Full Locking =  $2 * S$   
Where  $S = \mathbf{21*4 = 84}$   
 $2*S = 2*\mathbf{84} = \mathbf{168}$  Bytes
  - Fixed Locking and Cache-Sensitive Locking =  $(1 + 1/r) * S$   
Where  $S = \mathbf{21*4 = 84}$  and  $r = 21$   
 $(1 + 1/r) * S = (1+1/21)*\mathbf{84} = \mathbf{88}$  Bytes
3. In Ck with Size 3, we have 9 Reduction Element in one Reduction Object:
  - Full Replication =  $S * T$   
Where  $S = 9*4 = 36$  and  $T = 4$   
 $S*T = 36*4 = 144$  Bytes
  - Full Locking and Optimized Full Locking =  $2 * S$   
Where  $S = 9*4 = 36$   
 $2*S = 2*36 = 72$  Bytes
  - Fixed Locking and Cache-Sensitive Locking =  $(1 + 1/r) * S$   
Where  $S = 9*4 = 36$  and  $r = 9$   
 $(1 + 1/r) * S = (1+1/9)*36 = 40$  Bytes
4. In Ck with Size 4, we have 2 Reduction Element in one Reduction Object:
  - Full Replication =  $S * T$   
Where  $S = 2*4 = 8$  and  $T = 4$   
 $S*T = 8*4 = 32$  Bytes
  - Full Locking and Optimized Full Locking =  $2 * S$   
Where  $S = 2*4 = 8$   
 $2*S = 2*8 = 16$  Bytes
  - Fixed Locking and Cache-Sensitive Locking =  $(1 + 1/r) * S$   
Where  $S = 2*4 = 8$  and  $r = 2$   
 $(1 + 1/r) * S = (1+1/2)*8 = 12$  Bytes
